

Steel Price Forecasting Portal

User Manual · Guided Tour

SECTION 01

Getting started

The BigMint · AI Labs portal is a steel price-forecasting workspace: 12-week ensemble forecasts, accuracy tracking, analyst calls and what-if calculators. This manual mirrors the in-app **guided tour**.

Launching the tour

A guided walkthrough auto-runs the first time you open the portal. Use **Next** → to move on or the × to skip. You can replay it any time with the  **Take a tour** button at the top-right of the blue bar, beside **Log out**.

Signing out

Log out (top-right) ends your session securely. Sessions also expire on their own after 12 hours.

SECTION 02

Top navigation

The blue bar across the top is your main menu — every button opens one section of the portal.

The menu

Home, Price Forecasting, Analyst Calls, Performance, Calculators (Scenario Simulation) and **Methodology**. The active section is highlighted; click any button to switch.

SECTION 03

Home

The landing page: headline stats and quick-launch cards for every module.

Key stats

At a glance — products tracked, the 12-week forecast horizon, average accuracy (MAPA) and the latest data date.

Quick-launch cards

Shortcut cards jump you straight into a module — click any one to open it.

Methodology banner

A one-click jump to the methodology explainer.

SECTION 04

Price Forecasting

Spot price vs the 12-week Ensemble forecast for each steel product — chart plus a week-by-week table.

Product groups

Switch between commodity groups: **HRC, HR Plate, Rebar** and **Structural section**.

Graphical / Tabular

Flip between the chart and the week-by-week Actual-vs-Forecast table.

Location

Pick the exact grade / location within the group — it applies to both the chart and the table.

Forecast chart

Light-blue = actual spot, red dashed = the 12-week Ensemble forecast (violet = China import-parity landed cost on HRC). Hover any point for its price; use the zoom buttons above the plot (1W ... ALL).

Forecast horizon

Choose 1 / 4 / 8 / 12 weeks ahead — it drives how far the forecast is drawn and the forecast card below.

Price cards and rationale

The last actual spot, the selected-horizon forecast with an up / down / flat chip, and a short **forecast rationale** explaining the call.

SECTION 05

Analyst Calls

Monthly market-outlook notes: key insights, price drivers and downloadable decks.

Analyst call card

Each card is a monthly market-outlook call — its date, title and a headline summary.

Driver breakdown

A one-line read per theme: Flats, Longs, Raw materials, Imports and exports, and the Outlook.

Downloads

Grab the full market-summary **report (PDF)**, the analyst-call **pitchdeck (PPT)**, and a video link where available.

SECTION 06

Performance Dashboard

How accurate past forecasts were — accuracy %, directional hit-rate and weekly deltas.

Commodity group

Same group tabs as Forecasting — HRC / HR Plate / Rebar / Structural.

Location

Pick the grade / location whose forecast accuracy you want to score.

Accuracy scorecard

Headline metrics: absolute accuracy (MAPA), directional hit-rate, and delta accuracy over all weeks.

Accuracy charts and table

Actual vs forecast, then weekly delta, weekly absolute accuracy %, directional hits and delta accuracy — with a week-wise detail table at the bottom.

SECTION 07

Calculators

Three what-if tools live in tabs under **Scenario Simulation**. Everything recomputes live as you edit.

Tool 1 — Price Sensitivity

Pick a product (HRC / HR Plate / Rebar). Each card is a price driver — drag the slider or type a $\pm\%$ shock (presets and a per-driver reset included), or switch to **Table** mode for exact values. The contribution graph shows how your shocks flow through to the predicted price move; set the current price the shocks apply to, with a one-click reset for all shocks.

Tool 2 — Landed Cost

Imported (landed, duty-paid) price by origin vs the domestic benchmark — tells you whether importing is viable. Edit the per-location inputs (FOB, freight, BCD / cess / safeguard, port) then **Calculate**, or Reset to admin defaults. An **FX sensitivity** view recomputes landed cost across a range of USD→INR rates.

Tool 3 — Cost Head

Pick a route (BF / IF) and product to build its ex-works production cost. A stacked per-plant cost build-up (one segment per cost element) is shown vs the market price, with the mill margin overlaid. Every input in the table below is editable.

SECTION 08

Methodology

How the forecast is built: a hybrid ML approach on 15+ years of BigMint-assessed prices.

Track record

Headline accuracy of ~98% absolute, plus directional and delta accuracy, on an IOSCO-audited method.

The pipeline

Inputs (prices, cost and macro signals) → the forecasting model (market inputs, AI engine, forecast) → outputs (12-week path, direction, back-checked accuracy).

Key factors

The drivers the model weighs — cost, value-chain, global parity, supply / demand and macro.

Horizon

A 12-week rolling forecast, refreshed every week.

You're all set

That is the full tour. Click  **Take a tour** (top-right, beside Log out) any time to replay it. Happy forecasting!
